

PYTHON INTRODUCTION

POPULARITY

- 3rd in TIOBE Programming Community Index, measuring the popularity of programming languages
- Large community → More libraries to solve problems

Dec 2019	Dec 2018	Change	Programming Language	Ratings	Change
1	1		Java	17.253%	+1.32%
2	2		C	16.086%	+1.80%
3	3		Python	10.308%	+1.93%
4	4		C++	6.196%	-1.37%
5	6	^	C#	4.801%	+1.35%

SIMPLE AND HIGH-LEVEL

- simple syntax
- high-level: close to the English language

<u>high-level</u>

"Computer, sort this list alphabetically"

VS

<u>low-level</u>

"Take the first name and compare it to second, if the first letter is lower then put the name first etc...."

INTERPRETED

can run the program instantly

<u>interpreted</u>

runs instantly get instant feedback VS

compiled

have to build the code first to run need imagination to visualize code, no instant feedback

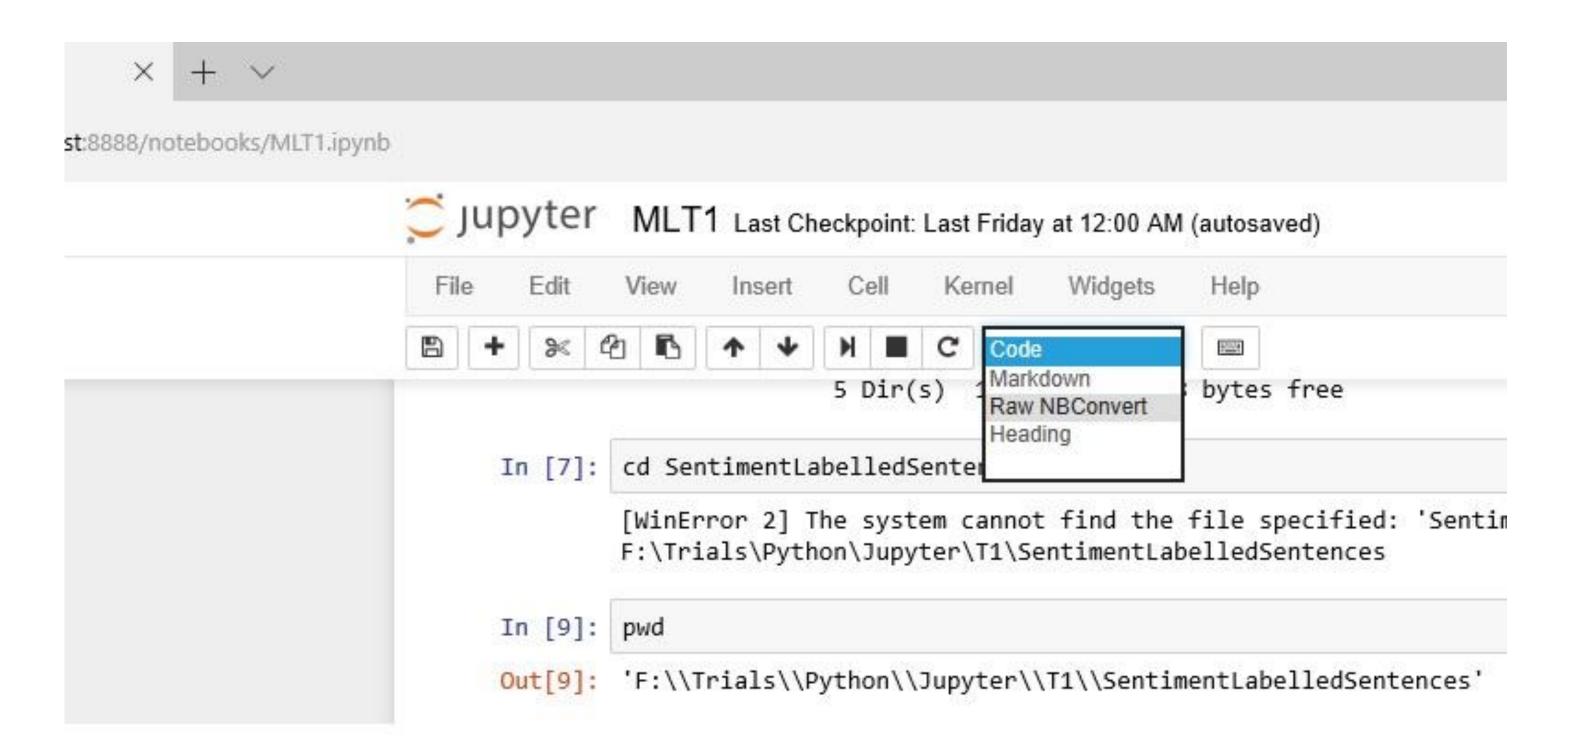

JUPYTER

- interactive development environment (IDE) where we can run code and view results instantly
- notebook file format (.ipynb)
 - o can mix HTML, markdown and code
- perfect for data analysis/science

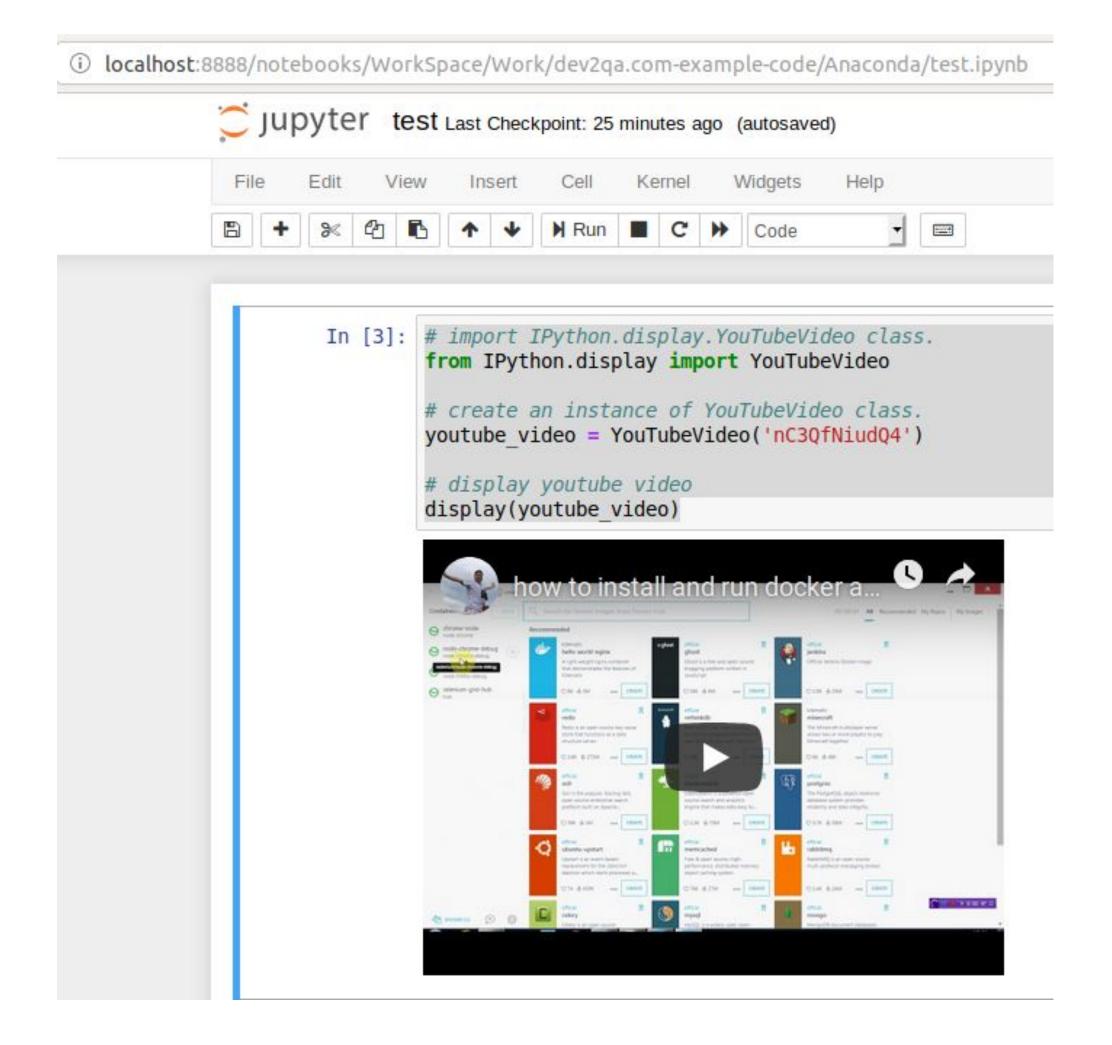

CELL TYPES

- Markdown
 - used to write text in notebooks
- Code
 - used to store code
- Raw
 - rarely used

MARKDOWN

- lightweight language for writing text documents
- markdown cells also capable of executing HTML

LATEX

language for writing mathematical equations

MAGICS

- specific to Python notebooks only
- add additional functionality to code cells
- For example in the below code, we can execute bash code in the notebook using bash magic

```
In [4]: %%bash echo "Hello World"
```

EXTENSIONS

- give more functionality to Jupyter notebooks
- little helper functions

- List of provided nbextensions
 - (some) LaTeX environments for Jupyter
 - 2to3 Converter
 - AddBefore
 - Autopep8
 - AutoSaveTime
 - Autoscroll
 - Cell Filter
 - Code Font Size
 - Code prettify
 - Codefolding
 - · Codefolding in Editor
 - Collapsible Headings
 - Comment/Uncomment Hotkey
 - contrib_nbextensions_help_item
 - datestamper
 - Equation Auto Numbering
 - ExecuteTime
 - Execution Dependencies
 - Exercise
 - Exercise2
 - Export Embedded HTML
 - Freeze
 - Gist-it
 - Help panel
 - Hide Header
 - Hide input
 - Hide input all
 - Highlight selected word
 - highlighter
 - Hinterland

KERNEL

- computational engine responsible for executing the code in a notebook
- can install kernels of other languages
- can have program notebooks of different languages
